## The bisection method

Let us find a root of $f(x)=x^{2}-3$. We note that $f(1)=-2$ and $f(2)=1$. Indeed, there is a root $r=\sqrt{3}=1.73205 \ldots$ on the interval [1,2].

| $n$ | $a_{n}$ | $b_{n}$ | $x_{n}$ | $f\left(x_{n}\right)$ | $\left\|r-x_{n}\right\|$ |
| :--- | :--- | :--- | :--- | ---: | :--- |
| 0 | 1 | 2 | 1.5 | -0.75 | 0.2321 |
| 1 | 1.5 | 2 | 1.75 | 0.0625 | 0.0179 |
| 2 | 1.5 | 1.75 | 1.625 | -0.3594 | 0.1071 |
| 3 | 1.625 | 1.75 | 1.6875 | -0.1523 | 0.0446 |
| 4 | 1.6875 | 1.75 | 1.71875 | -0.0459 | 0.0133 |

## Fixed-point iteration

To obtain the positive root of $f(x)=x^{2}-3=0$, we can rewrite the equation as

$$
x=g_{1}(x)=\frac{3}{x}, \quad x=g_{2}(x)=x-\left(x^{2}-3\right), \quad x=g_{3}(x)=x-\frac{1}{2}\left(x^{2}-3\right)
$$

Recall $r=\sqrt{3}=1.73205 \ldots$ Let us start the fixed-point iteration with $x_{0}=1.5$.

|  | Case 1 | Case 2 | Case 3 |
| :--- | :--- | :--- | :--- |
| $n$ | $x_{n}$ | $x_{n}$ | $x_{n}$ |
| 0 | 1.5 | 1.5 | 1.5 |
| 1 | 2 | 2.25 | 1.875 |
| 2 | 1.5 | 0.1875 | 1.6172 |
| 3 | 2 | 3.1523 | 1.8095 |
| 4 | 1.5 | -3.7849 | 1.6723 |
| 5 | 2 | -15.1106 | 1.7740 |

We see that Case 3 converges whereas Case 1 and Case 2 diverge.
